TASK 1 Use a weather forecast website, and utilize the psychrometric chart and the formula we went through in the class to determine the absolute humidity, the wet-bulb temperature and the mass of water vapor in the air in Classroom A (Aula A) of Piacenza campus in the moment that you are solving this exercise (provide the inputs that you utilized)

| Il tempo oggi in Piacenza Mercoledì, 04 Dicembre 2019 | | | | | | | | | | | | |

According to the table

 $T=4^{\circ}\mathbb{C}$

 $\omega = 79\%$

P = 102.7kPa

Water saturation pressure at 4 degree C:

0.813 kPa

 $ClassroomA: 12m \times 6m \times 5m$

From the chart,

$$T_{wb} = 3^{\circ}\text{C}$$

$$\omega = 0.004$$

$$\omega = \frac{0.622P_{v}}{P_{a}} = \frac{0.622P_{v}}{P - P_{v}} = 0.004$$

introduce

$$P = 102.7kP_a$$

$$P_v = 0.656kP_a$$

For ideal gas

$$m = \frac{PV}{R_{sp} \cdot T}$$

$$R_{sp} = 0.4615$$

$$m_{v} = \frac{PV}{R_{sp} \cdot T} = \frac{0.656 \times (12 \times 6 \times 5)}{0.4615 \times (273 + 4)} = 1.847kg$$

$$m_{g} = \frac{m_{v}}{\phi} = \frac{1.847}{79\%} = 2.338kg$$

$$h_{a} = 1.005 \times 3 = 3.015kJ / kg_{dryair}$$

$$h_{v} = 2501.3 + 1.82 \times 3 = 2506.76kJ / kg_{water}$$

$$h = h_{a} + \omega h_{v} = 3.015 + 0.004 \times 2506.76 = 13.04kJ / kg_{dryAir}$$

TASK 2 Utilize the same methodology we went through in the class and determine the sensible and latent load corresponding to internal gains, the ventilation, and the infiltration in a house with a good construction quality and with the same geometry as that of the example which is located in Brindisi, Italy

Good quality construction $A_{ul} = 1.4cm^2/m^2$

$$\begin{split} \dot{Q}_{ig_{sensible}} &= 136 + 2.2 A_{cf} + 22 N_{oc} = 136 + 2.2 \times 200 + 22 \times 2 = 620 W \\ \dot{Q}_{ig_{latent}} &= 20 + 0.22 A_{cf} + 12 N_{oc} = 20 + 0.22 \times 200 + 12 \times 2 = 88 W \\ A_{es} &= 200 + 144 = 344 m^2 \\ A_{L} &= A_{es} \times A_{ul} = 344 \times 1.4 = 481.6 m^2 \end{split}$$
